Increasing Sea Level

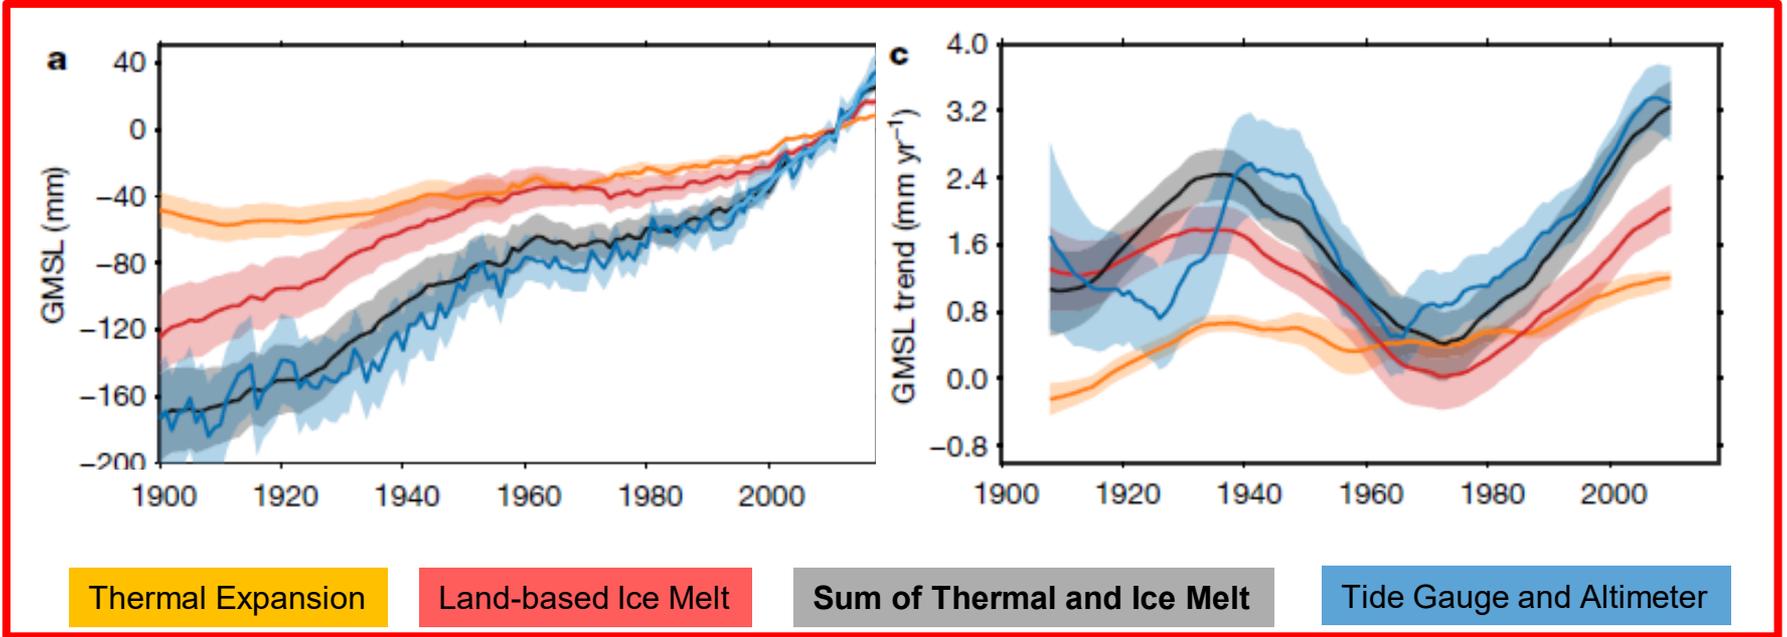

Historical Global Mean Sea Level

Sweet et al. (2017): Chapter 12 (Sea Level) in the NCA4 Volume 1: Climate Science Special Report

Increasing (Accelerating) Global Sea Level

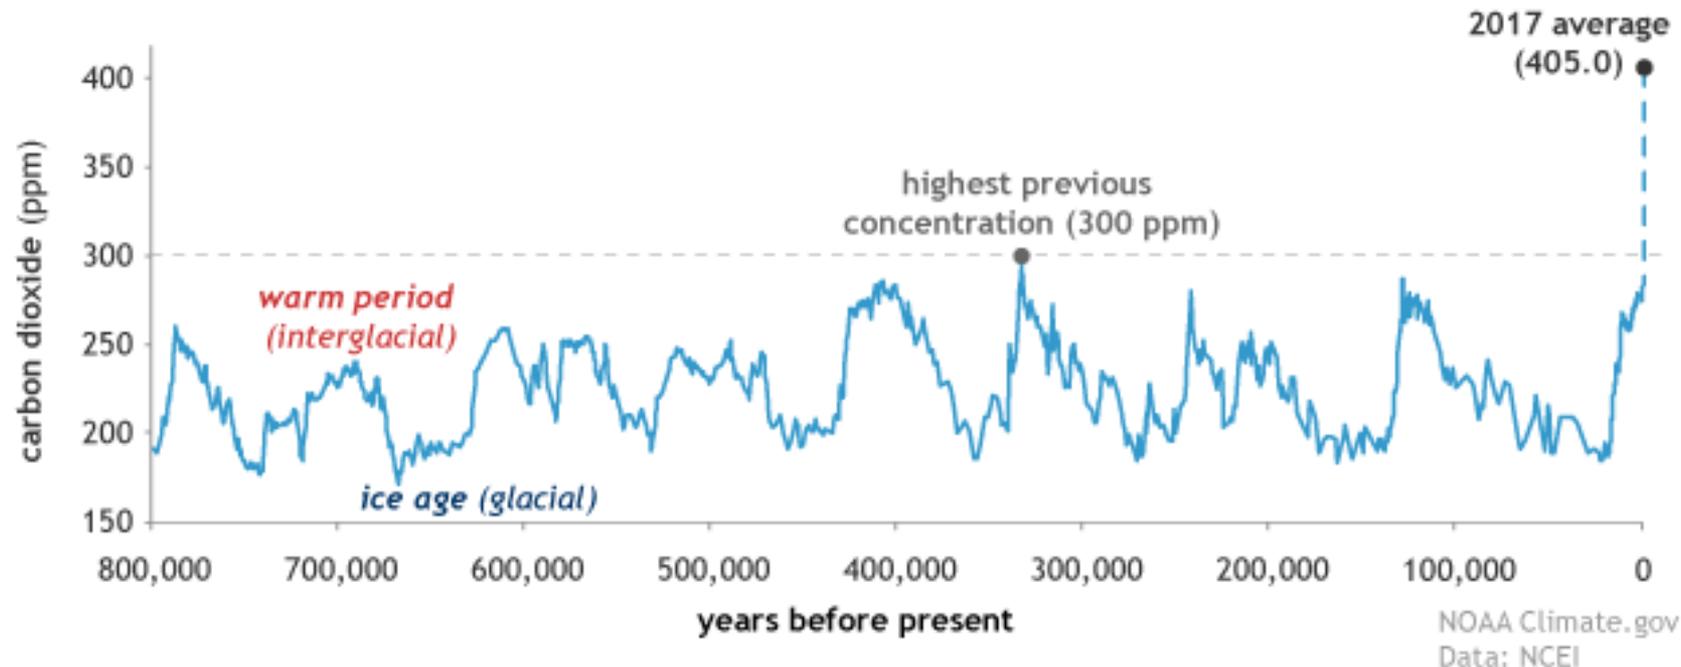

Frederikse et al. (2020): The causes of sea-level rise since 1900

Increasing Carbon Dioxide (ppm)

CO₂ during ice ages and warm periods for the past 800,000 years

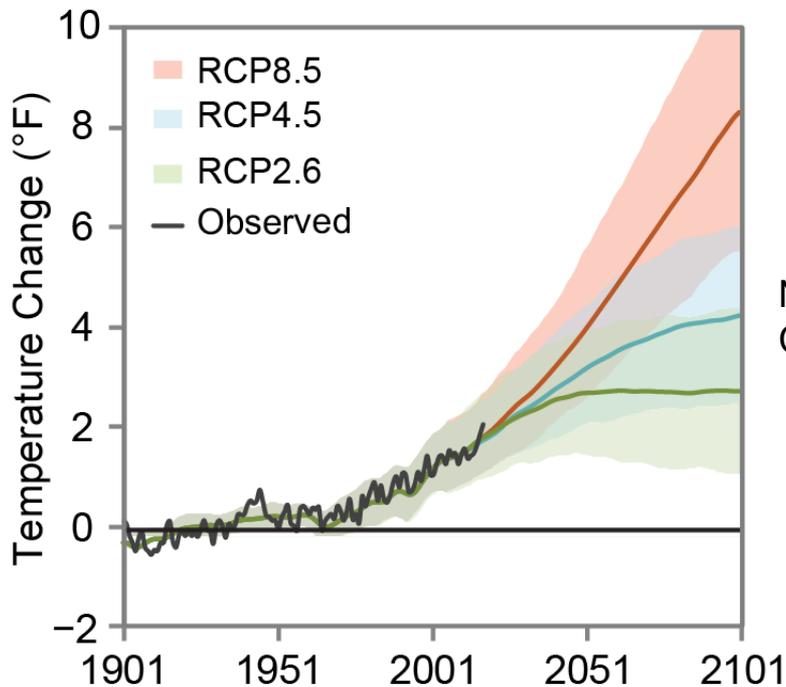

~420 in June 2021

Increasing Temperatures

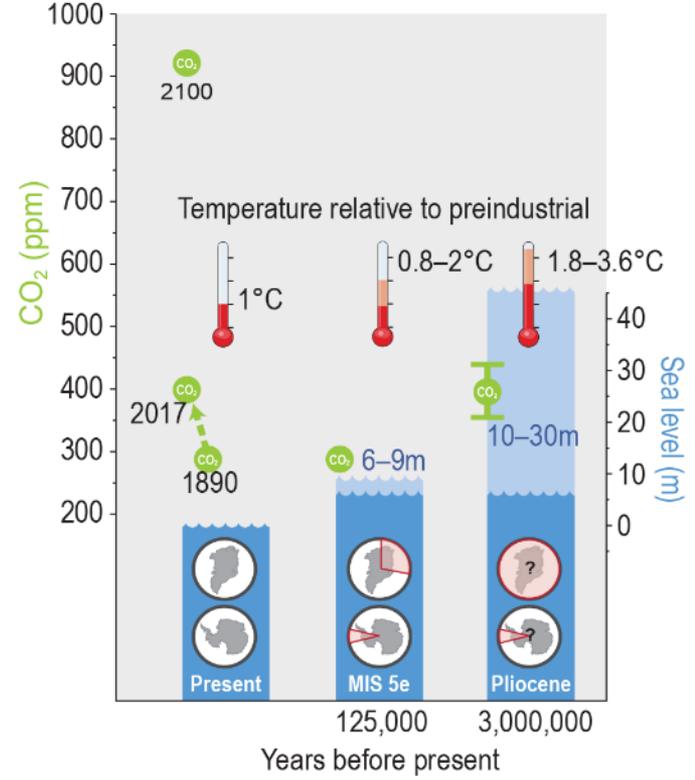

Projected Global Temperatures

NCA4 Volume 1:
Climate Science Special Report

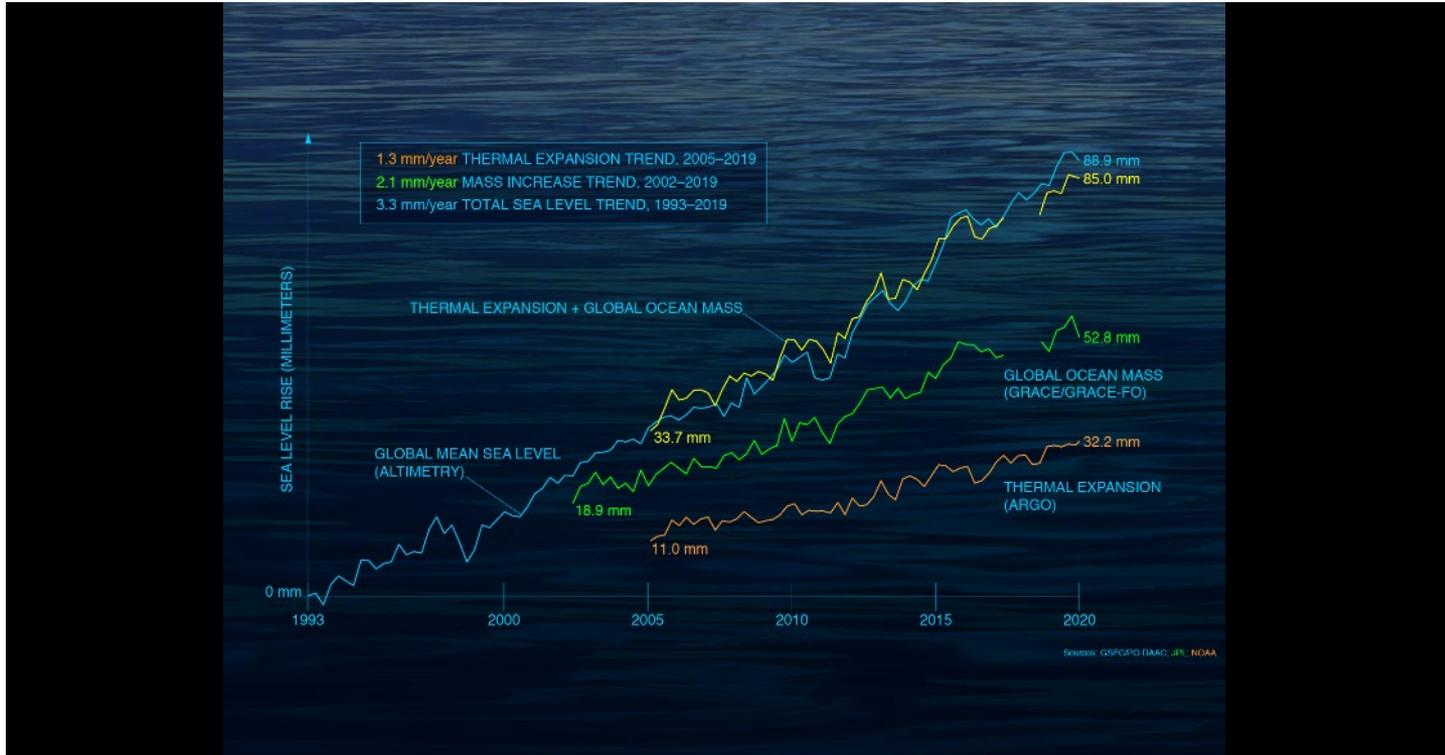

SLR, Carbon Dioxide, & Temperature

Sweet et al. (2017):
Chapter 12 (Sea Level) in the NCA4 Volume 1:
Climate Science Special Report

Primary Causes of Water/Sea Level Rise

Drivers of SLR

Global SLR Curves

Regionalized Projections

Risk Management

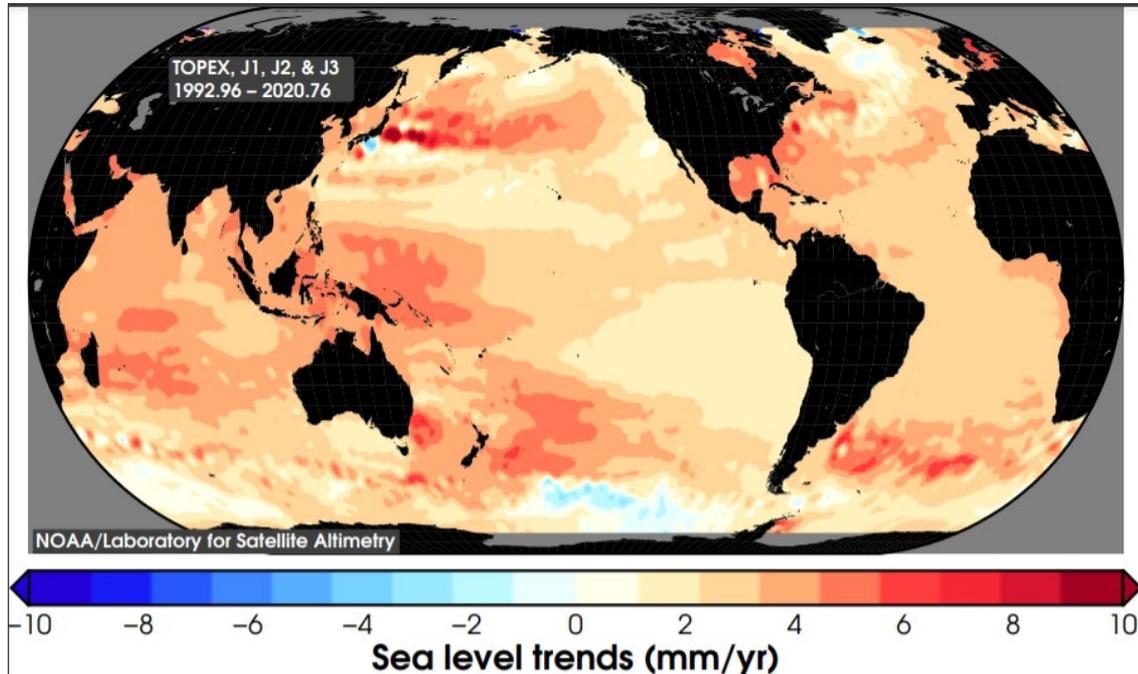

Future Uncertainty: Antarctica

4 feet of global sea level rise right in this vicinity (16 feet within West Antarctica)

Sea Level is Not Rising at the Same Rate Everywhere

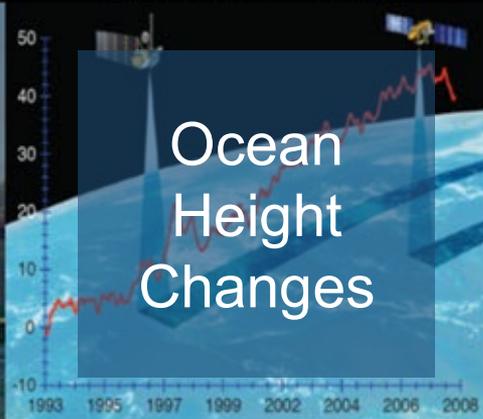

Measurement of Sea Level Rise

Water Level Stations

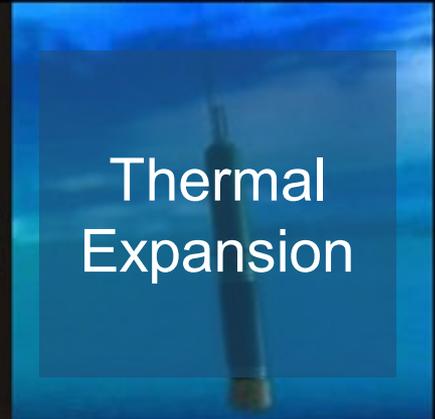

Satellite Altimeter

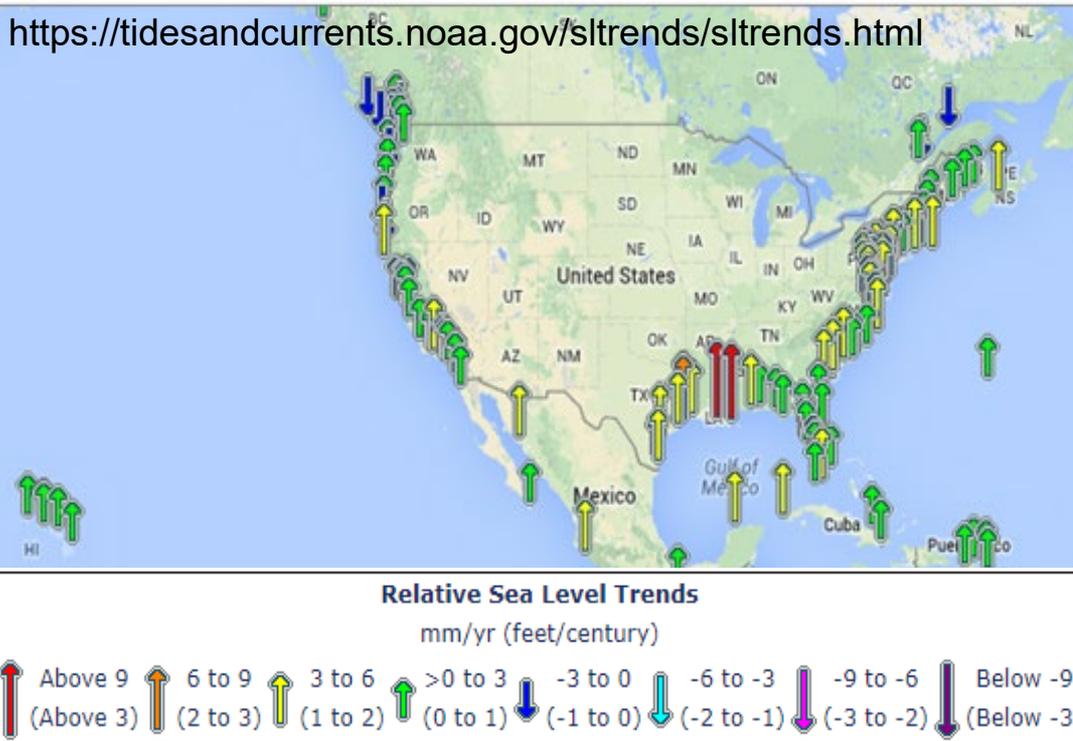

Gravity Measurements

ARGO Profilers

Measurement of Relative Sea Level Rise (including land motion)

Subsidence contributes about 0.5 mm/yr to sea levels in South Florida

Global Sea Level Rise Curves

January 2017

Sweet et al. (2017)

Global Sea Level Rise Curves

Table 4. Probability of exceeding GMSL (median value) scenarios in 2100 based upon Kopp et al. (2014).

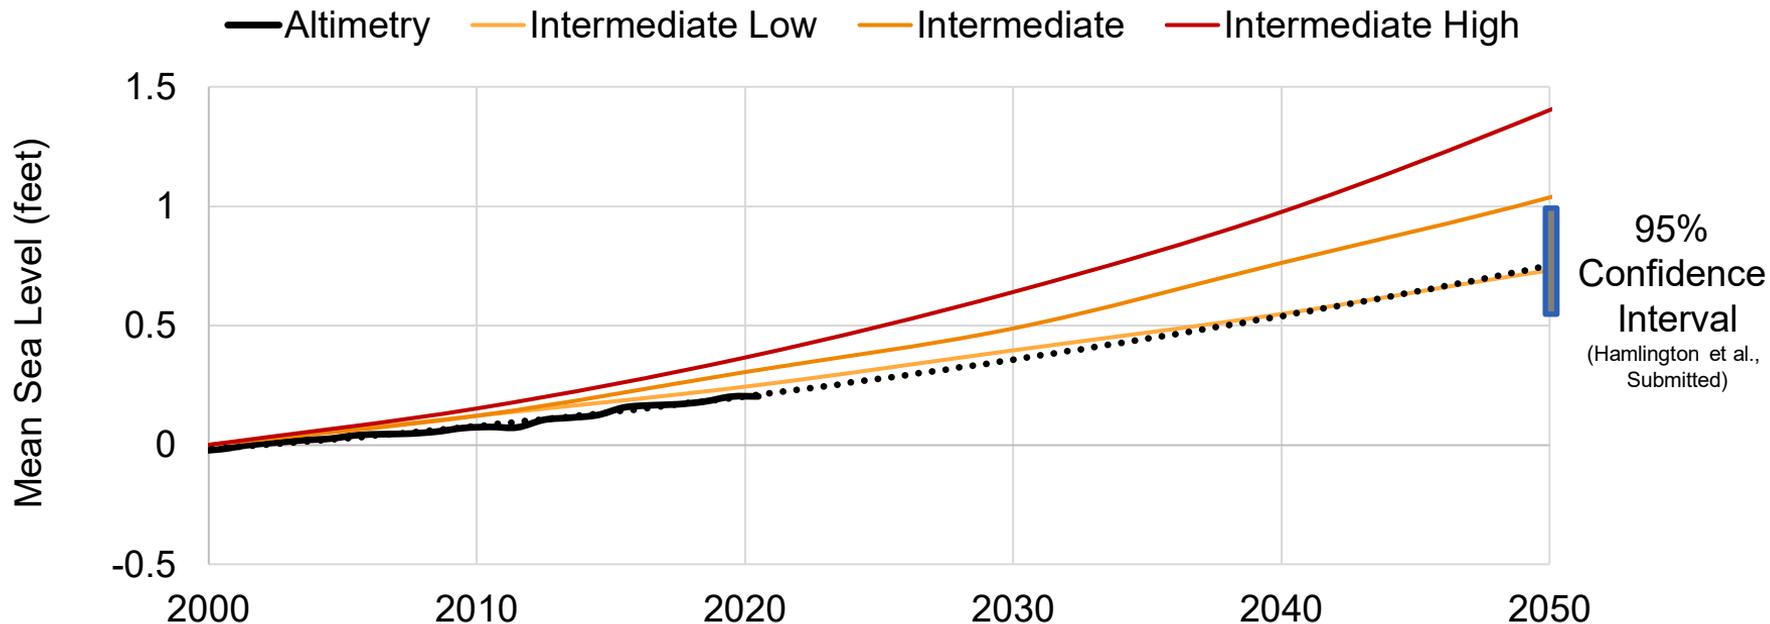

GMSL rise Scenario	RCP4.5	RCP8.5
Low (0.3 m)	Considered 'likely' under NCA4 lower & higher emissions	
Intermediate-Low (0.5 m)	73%	96%
Intermediate (1.0 m)	3%	17%
Intermediate-High (1.5 m)		
High (2.0 m)		
Extreme (2.5 m)		

Sweet et al. (2017)

Global Sea Level Rise Curves

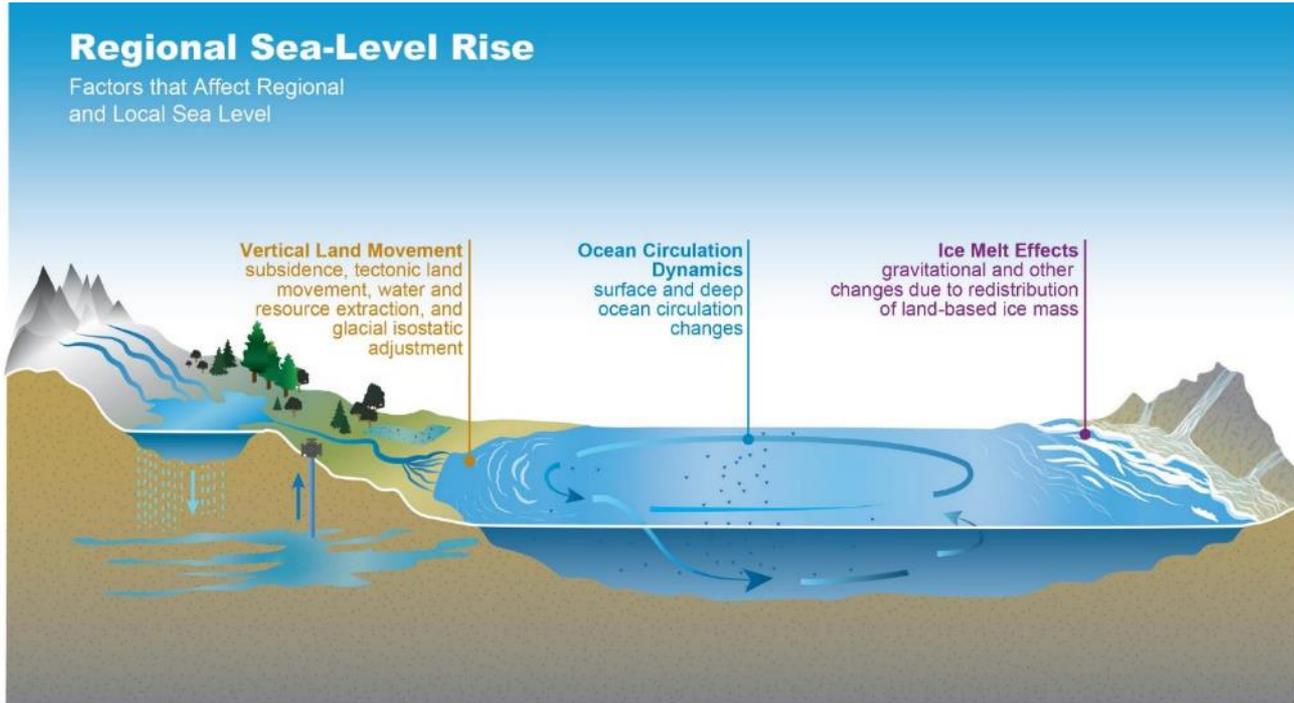

NOAA (2017) Global Sea Level Rise Scenarios and Altimetry

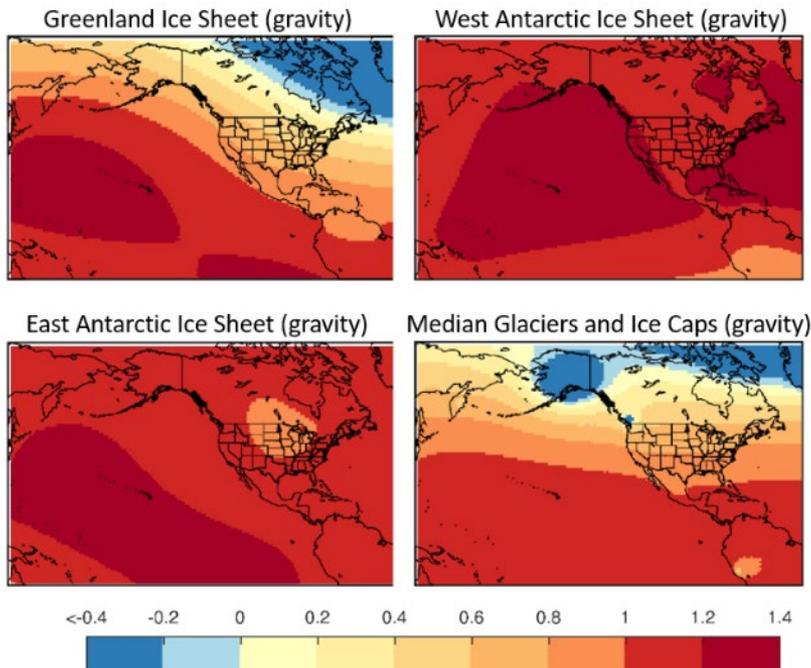

Relative Sea Level Rise Projections

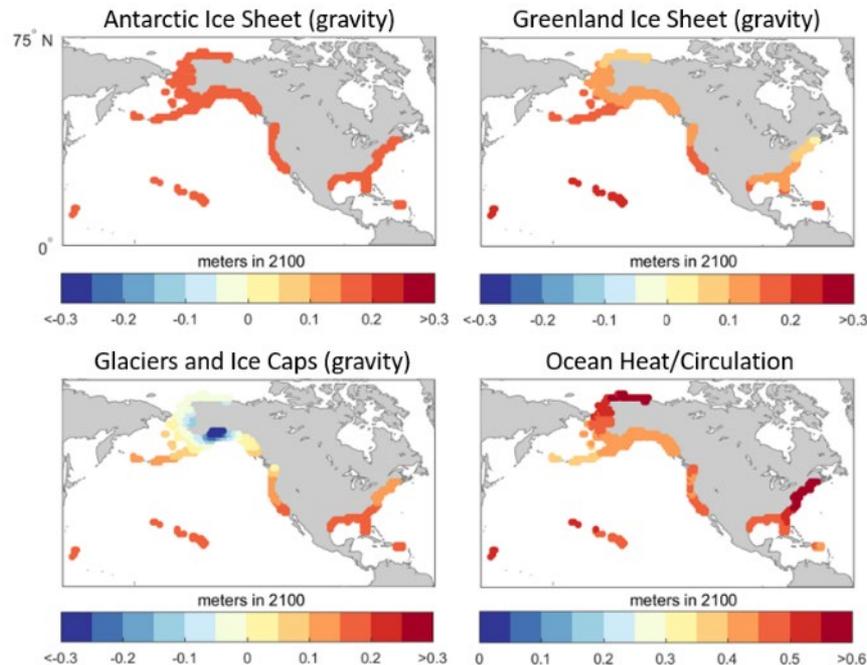

Relative Sea Level Rise Projections

Ratio of regional rise associated with global contribution (e.g., meters)

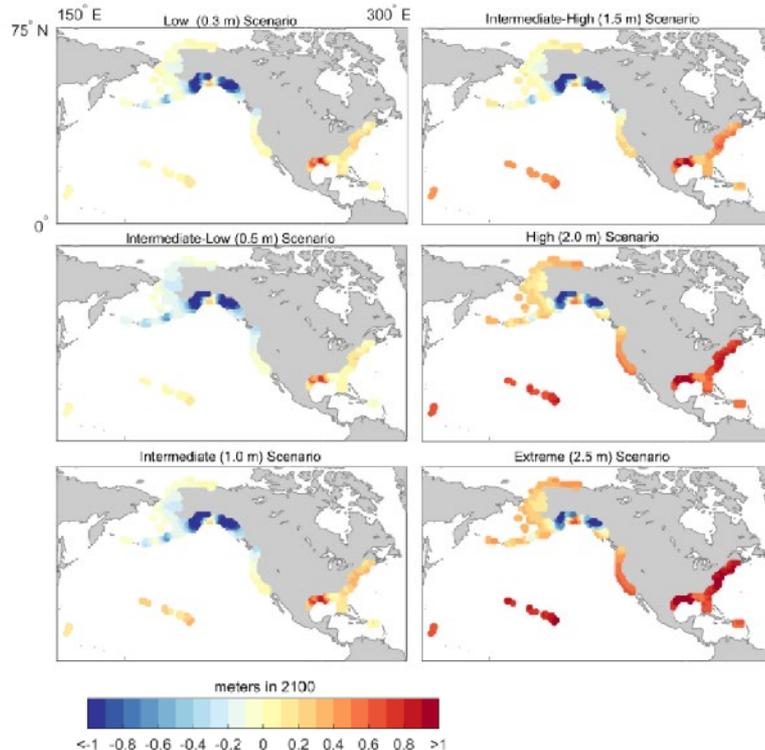

Components inherent to the Intermediate Scenario (1 m by 2100)

Sweet et al. (2017)

Relative Sea Level Rise Projections

Adjust Global SLR for:

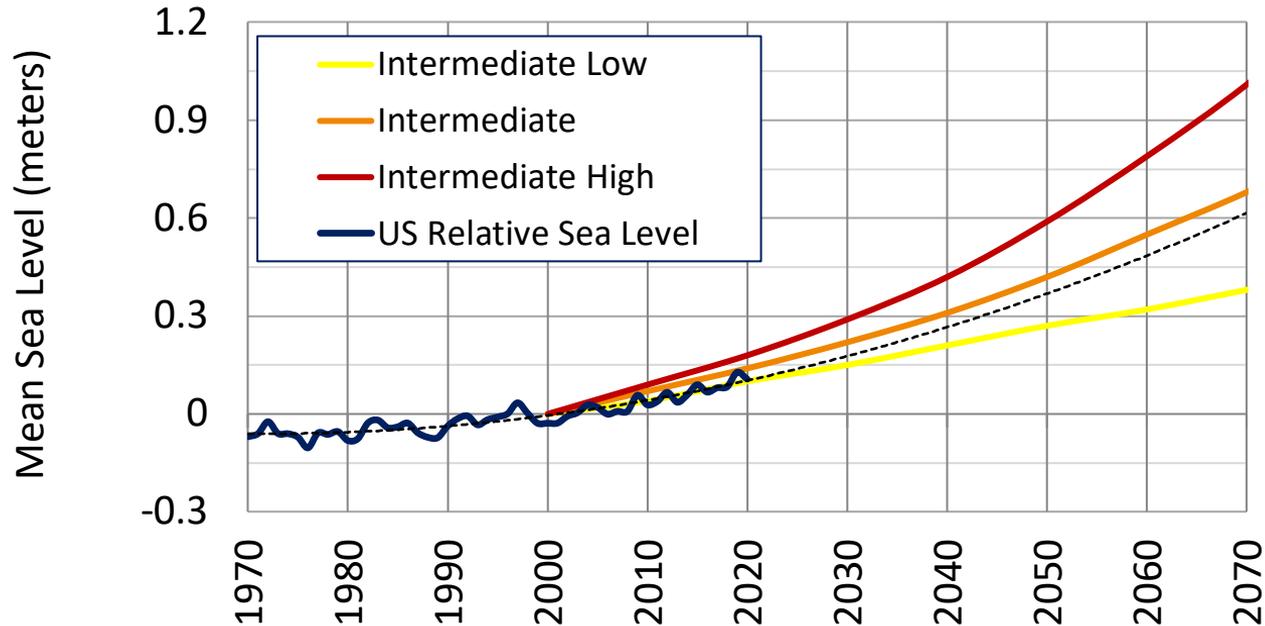

1. Ocean Circulation
2. Earth's Gravitational Field & Rotation
3. Vertical Land Movement

Sweet et al, 2017

Regional Sea Level Rise (Now Accelerating)

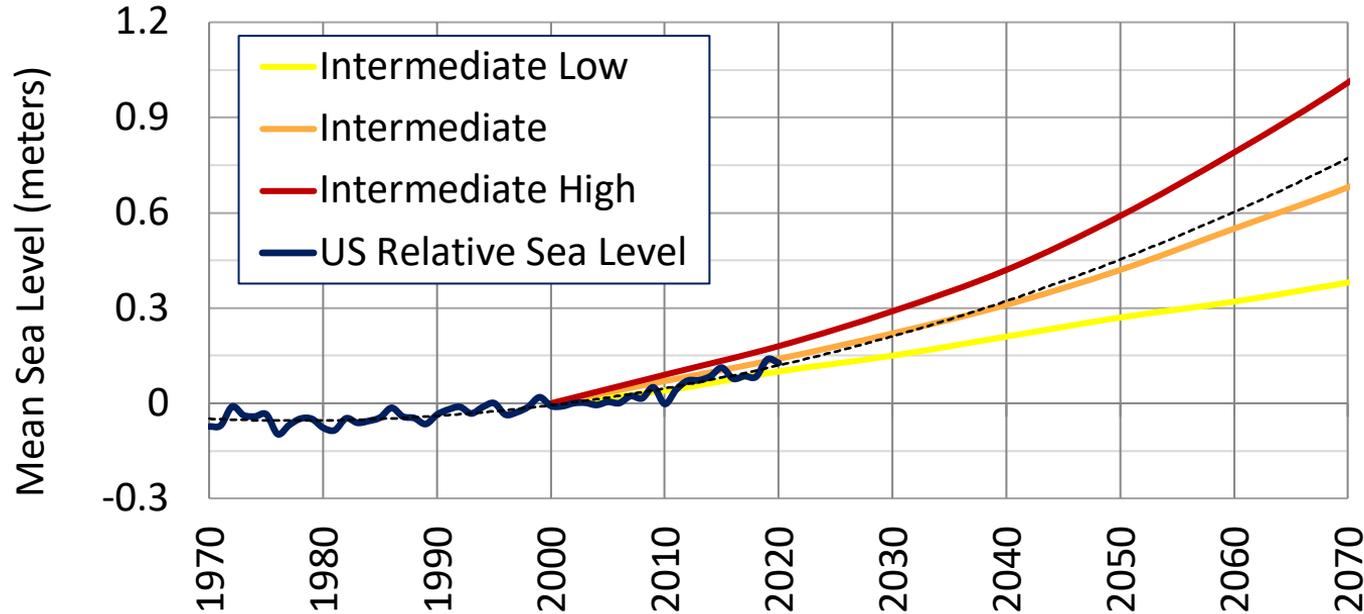

U.S. Coastal (median) Sea Levels and NOAA (2017) Projections

Regional Sea Level Rise

South Florida Coastal Sea Levels and NOAA (2017) Projections

South Florida Locations'

- Virginia Key
- Vaca Key
- Key West
- Naples

projections are nearly identical to national median

Future Impacts of Sea Level Rise

- SLR increases perennial inundation
- SLR exacerbates extreme probabilities
- SLR intensifies high tide flooding

SLR Will Make Future Storms Worse

FIGURE 3: Storm Surge and High Tides Magnify the Risks of Local Sea Level Rise

Coastal Flooding Thresholds

National Weather Service Wakefield, Virginia

	Minor	Moderate	Major
Picture	 <p>High Tide Flood</p>		
Hazard	<ul style="list-style-type: none">➤ Shallow flooding in the most vulnerable locations near the waterfront and shoreline resulting in a low threat of property damage.➤ Up to 1 foot of inundation in shoreline and vulnerable areas.	<ul style="list-style-type: none">➤ Widespread flooding of vulnerable areas will result in an elevated threat of property damage.➤ 1 to 2 feet of inundation primarily in shoreline and vulnerable areas.	<ul style="list-style-type: none">➤ Severe flooding will cause extensive inundation and flooding of numerous roads and buildings resulting in a significant threat to property and life.➤ 2 to 3 feet or more of inundation.
Impact	<ul style="list-style-type: none">➤ A few shoreline and vulnerable roadways and adjacent properties will experience shallow flooding.➤ Minor beach erosion with possible erosion to the front of vulnerable dune structures.	<ul style="list-style-type: none">➤ Inundation of roads and low lying property near the waterfront.➤ Flooding will extend along tidal rivers and creeks resulting in some road closures, flooding of vehicles, and some property.➤ Severe beach erosion and considerable erosion of dunes, especially during long duration events.	<ul style="list-style-type: none">➤ Numerous roads will be impassable, with many unprotected cars submerged.➤ Evacuations will be necessary for the most vulnerable areas.➤ Flood waters may extend well inland.➤ Substantial coastal damage and severe erosion of dunes.

In South Florida: these heights (above high tide) are:

- Minor: 0.5 m
- Moderate: 0.8 m
- Major: 1.2 m

Some **surface** flooding occurs about 0.3-0.4 m above high tide.

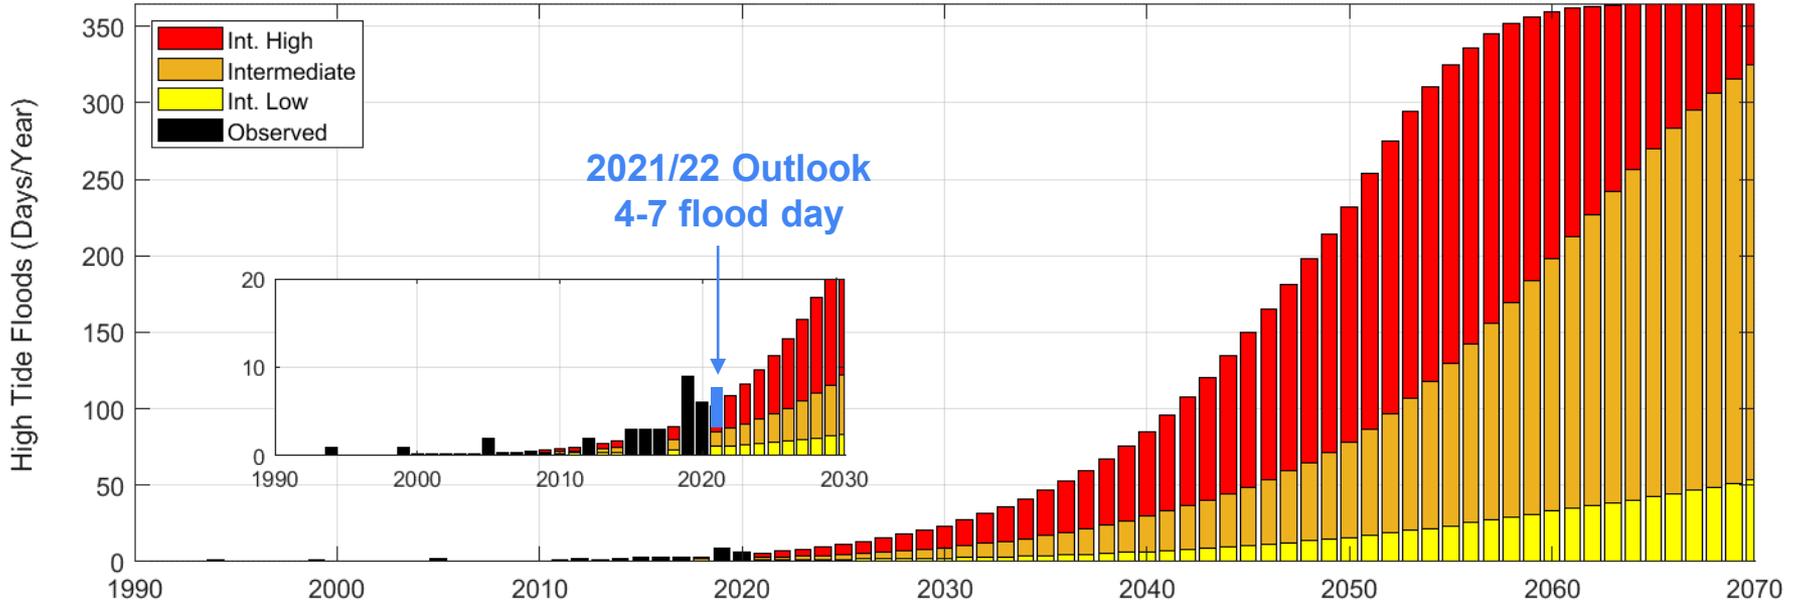

Critical Thresholds Reached More Often

How Will Coastal Risk Change with SLR?

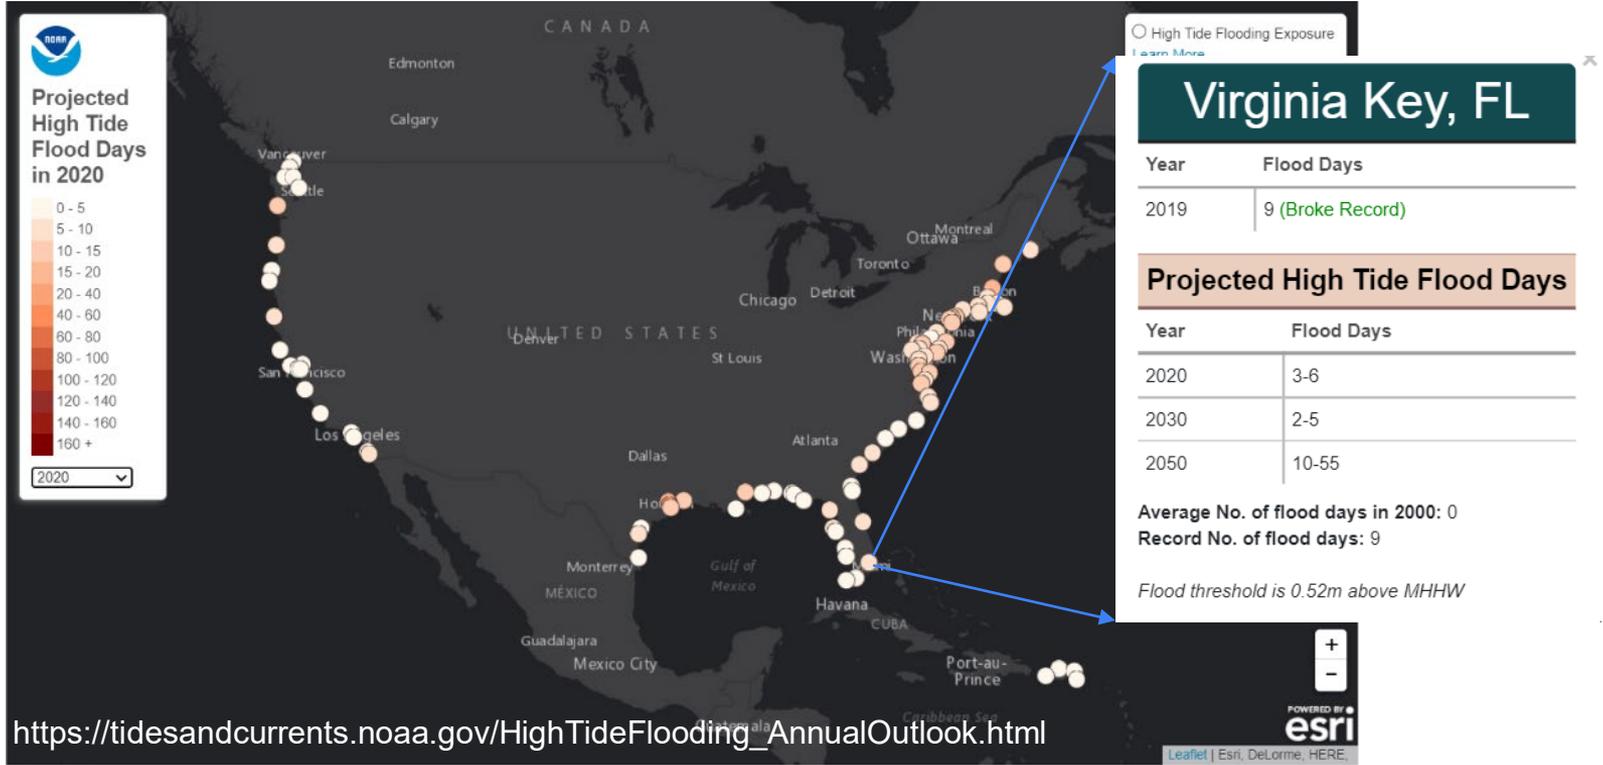

High Tide Flood Days measured by NOAA Tide Gauge Virginia Key, FL
(water levels exceeding 1.75 feet above highest tide)

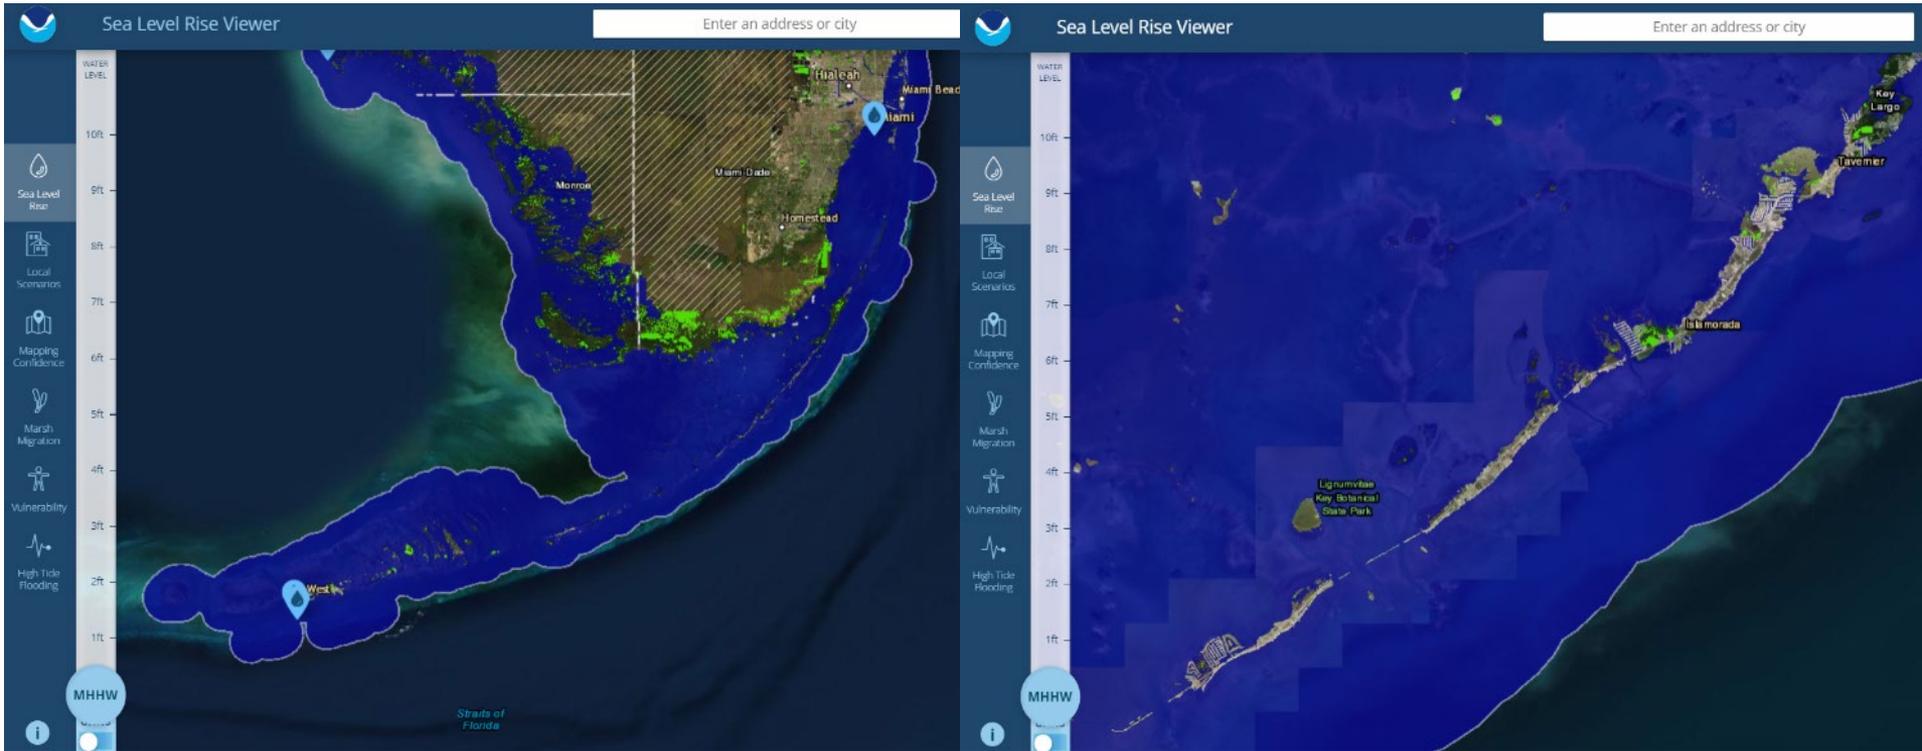

NOAA/Sweet et al. (In Press). U.S. State of High Tide Flooding with a 2021 Outlook

How Will Coastal Risk Change with SLR?

SE US										0.9	0.2	0.05	2.0	0.3	0.07	>10	2 to 5	0.2 to 0.3
S.Great Plain																		
SW US																		
NW US																		
Alaska										↑	↑	↑				↑		
US Carib										Once in 5 years	Once in 3 years				2-5 per year			

Drivers of SLR

Global SLR Curves

Regionalized Projections

Risk Management

To Conclude:

Already flood risk from compounding factors (e.g., sea level, groundwater, rainfall) is increasing in many locations like South Florida.

Annual variability is now affecting flood risk, commerce & budgeting.

Stay tuned on ice sheet science and emissions:

- The exact future is unknown, but 'when not if' scenario planning can help frame 'futures'.

To manage risk, multiple SLR scenarios can help communities think about their risk tolerance:

- If low cost, short-lifetime asset, Intermediate Low curve might be fine
- If high cost, long-lifetime/critical asset, Intermediate-Int. High projections can help minimize risk and add protection from compounding risks
